Maldane sarsi Malmgren, 1865
Maldanidae

SCAMIT Codes: LACO 47, PL 58

Date examined: March 3, 1985
Voucher by: Karen Green (MEC)

Literature:
Arvidsson, 1907
Fauvel, 1914
Green, 1984

Diagnostic characters:
1. 19 setigerous segments, 2 asetous preanal glandular pads.

2. Cephalic plaque with smooth lateral and posterior margins. Posterior margin forms deep pocket. Prostomial palpode semitriangular, keel long and high, and nuchal organs short and gently curved.

3. Anal plaque divided into two reduced lobes; dorsal margin smooth, ventral margin smooth to crenulate.

Additional notes:
The syntype of Maldane cristata and type material of M. sarsi were examined and are equivalent; records of M. glebifex from the eastern Pacific are questionable (Green, 1984; unpublished thesis).

Distribution:
Alaska south to Antarctica, Japan, Arctic Ocean, Baffin Bay, Davis Strait, and Skagerrak. Depths from 3 to 3034 m.
