fig. 13

Synchelidium rectipalmum

DIAGNOSIS

Characterized by:

1. Palm of gnathopod 1 propodus almost perpendicular to lower margin
2. Basis of peraeopod 5 rather narrow, posterior margin with long setae.
3. Head not strongly vaulted; rostral apex not strongly downturned, rather blunt; antennal sinus shallow.
4. Outer plate of maxilliped with nine rather long spines.
