**Acidostoma hancocki** Hurley, 1963

Lysianassidae

---

**Depth range:**
30-75 m.

**Distribution:**
Southern California.

**Ecology:**
Females have been collected in sediment samples while males are usually found epibenthic samples.

**Additional comments:**
Hurley (1963) described this species as eyeless; in preserved specimens, an eye present but very difficult to see (see Vol. 2, No. 10 of SCAMIT Newsletter).
