**Anopla sp. C SCAMIT 1995**

**Group:** Nemertea: Anopla

---

**SCAMIT CODE:** None

**Date Examined:** 8 November 1995

**Voucher By:** Dean Pasko

**SYNONYMY:** Anopla sp. SD2 of CSDMWWD

**LITERATURE:**

**DIAGNOSTIC CHARACTERS:**

1. Body light colored (cream to tan or light olive), thin, elongate and thread-like.
2. Head somewhate elongate and rounded anteriorly.
3. Mouth modereatly seperated from proboscis pore.
4. White band present anteriorly, just anterior to mouth.

**RELATED SPECIES AND CHARACTER DIFFERENCES:**

1. This species closely resembles Anopla sp. D SCAMIT in being an elongate, white, fairly featureless nemertean; however, Anopla sp. D has a mouth much separated from proboscis pore, a head that is tappered anteriorly, and a white body without a white band near the mouth.

**DEPTH RANGE:** 90-120 m

**DISTRIBUTION:** Found off Point Loma, California in silty sediments at shelf depths.
