

Arhynchite californicus Fisher 1949

E-2① (3 spms)
4-1-97
317 FT.

2 Nephridia (1 pair)
body (TRUNK) elongate
proboscis elongate, narrow - may =
 $\frac{1}{2}$ length of TRUNK

Anal vesicles small / inconspicuous*
muscle bands NOT visible in body
wall

* This conflicts with family definition

Differences from Listriobolus

- ① elongate rather round TRUNK
- ② 1 pair of nephridia (large) rather than 4 pair of small nephridia.
- ③ setae closely set and expanded distally - vs well separated and NOT expanded
- ④ ~~external nephridiopore (?) situated on short "STALK" vs NO STALK.~~
- ⑤ Anal vesicle elongate, ~ $\frac{1}{2}$ body length.
